

Cleaning copper-

Your tools are made of copper, which can tarnish.

This naturally occurring “**Patina**” can be removed with a **solution of Vinegar and Salt**.

Simply dip for a few seconds and rinse.

The patina does not affect the energetics of the tools, and cleaning them is for aesthetic purposes only.

To shine the tools back to new, you can use fine grade “**steel wool**”, found at your local hardware store. **Use caution, and gloves**, when handling steel wool. We recommend using steel wool in the outdoors, taking care to **not breath in the dust particles**
